

## Abstract of the Disclosure

A case with randomly adjusting handle comprises a shell, frame, spring, fastening member, positional member, sleeve and removable  
5 member. Further, the shell comprises a button depositing an opening in the top. The button connects to the removable member between the frame, spring, fastening member, positional member and sleeve. When the user presses and holds the button of shell, the removable member could move down and turn an angle resulting in the handle moving an  
10 angle.
